Dale Durham

Hammond, IN daledurhampro@gmail.com

Software engineer with over 10 years of experience with a strong focus on AI automating manual processes into self-service products and workflows, reducing operating costs and creating new revenue streams.

Lead Software Engineer | eDist | Jan 2022 - Jun 2026

Reported directly to the COO and provided architectural and team leadership for multiple engineering teams responsible for SaaS platforms delivering AI-powered speech recognition, clinical documentation, workflow automation, and healthcare technology solutions serving enterprise customers and VARs.

- Automated end-to-end VAR decommissioning, migrating all customers, orders, recurring subscription billing, and licenses to successor VARs. Built an agentic workflow that ran the database transfers, regenerated licenses and emailed them to affected end users, and notified receiving VARs of their newly assigned accounts. This cut transfer time from 1+ weeks to under an hour (~99% faster), removed former manual DB changes by engineering, and eliminated post-transfer "can't log in" support calls resulting in ~$30K/year in labor savings.
- Created an AI based data migration wizard that migrated years of complex legacy data to new completely different greenfield data structures on demand to any new environment. This facilitated ongoing testing and deployment of eventual production greenfield project data and production like dev and test environments.
- Maintained continuous SOC 2, ISO 27001, and HIPAA compliance by partnering with IT to integrate Vanta and AI-driven monitoring into development workflows, automating 99% of evidence collection and cutting audit prep time by 93% (from 2 weeks to 1 day).

Senior Software Engineer | Epapers | Jan 2012 - Dec 2021

Sole technical resource responsible for all aspects of a mission-critical SaaS platform supporting global IEEE and academic conferences, including software architecture, product development, infrastructure, DevOps, security, databases, customer integrations, and operational reliability.

- Built a conference setup wizard that cut setup time by 95% and saved $100K annually, while enabling a paid self-service option that generated $50K in new annual revenue.
- Added REST APIs that enabled customers to self-service custom reports, supported seamless integration with conference registration vendors, and automated key internal workflows, contributing to an estimated 20% reduction in overall operating costs.
- Reduced conference submission peer review times by more than 30% by redesigning a legacy form-based review module into a modern grid-based interface, significantly improving usability and reviewer efficiency. The enhancement drove customer satisfaction, increased client retention, and helped attract conferences from competing platforms, resulting in substantial revenue growth.

PROJECTS

- Built and deployed an AI "digital twin" that lets prospective employers interview a virtual version of me, powered by Amazon Bedrock LLMs customized with my professional background, skills, and communication style. Developed a Next.js frontend deployed as a static website stored in S3 and accessed via CloudFront. The backend uses FastAPI sunning as a serverless AWS Lambda function behind API Gateway, with S3-backed conversation memory, and automated provisioning and deployment using Terraform and GitHub Actions CI/CD pipelines. [Repo] | [Live Prod Version]

CERTS

- Microsoft Certified: AI Business Professional
